The Web-based photo lineup is here. Now detectives and other law enforcement personnel can create and display their own multi-person lineups – in the office or in the field – without having to wait for a technician to become available. *Laptop Lineup* is a unique tool that's quick and easy to use. It takes just a few moments to upload the suspect's photo and enter demographic and personal characteristics. *Laptop Lineup* does the rest – searching Thinkstream's database of more than 100,000 booking photos, selecting those that resemble the suspect's and displaying a six or eight person lineup. No more waiting around to schedule lineups. No more laborious manual searches through limited departmental photo files. *Laptop Lineup* does it all for you.

Working with Laptop Lineup

If you have a Laptop PC, a Web browser and a photo of your suspect, you're ready to put *Laptop Lineup* to work. Uploading or browsing for the suspect's photo and entering demographic and personal characteristics such as age, race, gender, height and weight takes just a few simple steps.

Gender:	Male	Hair Color:	Brown
Height:	6'0"	Weight:	175
Beard:	Yes		

From there, everything is automatic. *Laptop Lineup* connects via the Web to Thinkstream's mugshot database, selects suitable matches and generates a preliminary six or eight-person lineup. If any of those preliminary matches are deemed unsuitable – or not suitable enough to stand up in court – it's a simple matter to tag photos to be replaced, request additional matches, accept or reject any selection or adjust the search parameters until an ideal lineup is created.

Features of Laptop Lineup

Easily Generates Lineups – The software allows users to quickly and effortlessly create six and eight-person lineups with a full-screen identification view, and the ability to randomize the suspect's photo in the lineup.

Over 100,000 Mugshots to Choose From – *Laptop Lineup* connects via the Web to a secure server that contains Thinkstream's enormous database of booking photos. No longer does an agency or department need to create, update and maintain its own database – or file cabinet – of photos.

Automatically Retrieves Photos Similar to Suspect's – It takes only a few moments to enter demographic and other personal descriptors, such as race, gender, age, height and weight. *Laptop Lineup* takes it from there, swiftly retrieving suitable matches and generating a lineup of similar photos.

Six and Eight Person Lineups – It's up to the preference of the user to choose – at a keystroke – how many additional photos to include and whether or not to randomize the suspect's photo.

Selectively Keep/Reject Photos – If any of the selected photos don't match the suspect closely enough, the user can quickly "tag" any photos to be replaced. *Laptop Lineup* then re-searches the database for additional candidates, while saving the most suitable selections from the earlier search.

Field or Office Use – Lineups can happen anywhere there's a laptop PC with an Internet connection, giving officers unprecedented flexibility. The ability to take the lineup to the witness – instead of the other way around – makes identification happen much more quickly, and much more reliably.

About THINKSTREAM

In little more than a decade, Thinkstream has emerged as a proven leader in the creation and expansion of distributed information networks that provide communication and interoperability to the nation's public safety and criminal justice agencies, while also assisting banks and businesses with fraud detection and prevention. We have developed and marketed a series of solutions and products that tie agencies, branches or offices together – securely – and enable them to rapidly share critical information across organizational, agency and geographic boundaries.

Everything is built around our Distributed Information integration Platform, a robust

and highly scalable framework for the development of integrated systems. This patent-pending platform is an evolutionary step forward from previous technologies that require drastic change or even replacement of existing systems – an expensive, risky and time consuming process. In lieu of altering or replacing these existing systems, Thinkstream extends them into an efficient, cost-effective network that's surprisingly easy to use.

Our networks deliver reusable, flexible, real-time views of information that is scattered amongst myriad databases, Web sites and desktop PCs. Powered by the Thinkstream Platform, our networks can scale to

encompass hundreds or even thousands of information systems.

Thinkstream has the only technology on the market that can enable integrated criminal justice throughout entire state, multi-state or even nationwide networks. Similarly, it is the only technology available that can provide instant, up-to-date identity verification that is 100% accurate. The company is currently operating the Louisiana Civil and Criminal Information Network, considered to be the largest of its kind in the nation. Thinkstream is an active member of the Internet Working Group for Justice Integration Committee, established by the U.S. Department of Justice.
