

Designed with the direct input of law enforcement personnel, *Street Smart* is a complete solution you can depend on to wirelessly access and disseminate mission critical information anytime, anywhere. This powerful, flexible set of communication tools provides officers with deep, real-time searching and messaging capabilities, together with comprehensive mobile field reporting. Officers can quickly call up complete rap sheets – including mug shots – create, file and track the status of reports, and communicate more effectively with other officers than ever before.

Working with *Street Smart*

It all begins with the Mobile Network, which puts the power of information at every officer's fingertips. Working from a license plate number, *Street Smart* searches hundreds of databases around the country in real time, merges the results and displays not only the vehicle registration information, but a full criminal background check on the vehicle's owner. Officer situational awareness has arrived at a whole new level of effectiveness and safety.

Advanced messaging capabilities allow field officers to communicate more securely, efficiently and effectively – Unit to Unit, Group to Group and Dispatch to Unit – via integrated agency e-mail and secure instant messaging. *Street Smart* is also equipped with alert messaging, including Hit Confirmation Alerts, Be On the Lookout (BOLO) and Amber Alerts, as well as an emergency Alert button for situations when an officer requires immediate assistance and Dispatch needs to send a query screen down to his unit.

Instead of waiting until they've returned to the station, officers can use *Street Smart* to complete all types of reports in the field including Incident, Accident and Citations. Wizard-driven and user friendly, it's equipped with an Officer Inbox, which allows the user to easily determine the status and location of any report in the system. Also available is Full Workflow, for supervisor approval/rejection and annotations.

Easy to Use – Designed with the guidance of people on the front lines of law enforcement, *Street Smart* is optimized for a mobile environment. Its intuitive touch screen interface makes queries easy to enter and hits are highlighted visually.

Robust Search Capabilities – Comprehensive, consolidated query results are obtained in real time from hundreds of databases including NCIC/NLETS, State, Local and a variety of other justice-based criminal information sources around the globe. Search results can be stored and merged into field reports.

Dynamic Field Reporting – Provides officers in the field with the most comprehensive reporting capabilities in the industry to create incident, contact, arrest, DUI and crash reports. Also allows officers the ability to create and print citations and includes supervisor approval processing.

Robust Instant Messaging – Delivers critical information to officers through on-screen alerts and connects them to commanders, stations and other officers.

Seamless Integration – *Street Smart* seamlessly interfaces with Computer Aided Dispatch, Records Management and Thinkstream's Advanced Data Query, Messaging, Field Reporting and Mapping applications resulting in a single solution for mobile computing in the public safety sector.

Enhances Officer Safety and Public Protection – Provides officers with a complete criminal history and alerts instantly, enabling a more informed assessment of any situation and the ability to correctly assess the need for backup before proceeding to the vehicle. Officer productivity benefits from faster stops due to the elimination of lengthy delays waiting for checks to be completed.

Reduces Radio Traffic and Improves Accuracy of Data – Since *Street Smart* virtually eliminates the need for dispatchers to research suspects and vehicles on behalf of officers in the field, each dispatcher is able to handle more calls and support more field officers.

Facilitates More Accurate and Complete Reports – By utilizing an automated field reporting workflow, the timeliness and accuracy of reports can be greatly enhanced. The ability to decipher the handwriting of field officers is no longer a required skill for those tasked with reading reports.

Saves Money and Time – Because *Street Smart* works with existing systems, law enforcement agencies can continue to use those systems and the processes they're used to, in order to manage their own data – no need for costly modifications or lengthy training. Money is also saved through increased officer efficiency and streamlined report writing and processing.

About THINKSTREAM

In little more than a decade, Thinkstream has emerged as a proven leader in the creation and expansion of distributed information networks that provide communication and interoperability to the nation's public safety and criminal justice agencies, while also assisting banks and businesses with fraud detection and prevention. We have developed and marketed a series of solutions and products that tie agencies, branches or offices together – securely – and enable them to rapidly share critical information across organizational, agency and geographic boundaries.

Everything is built around our Distributed Information integration Platform, a robust

and highly scalable framework for the development of integrated systems. This patent-pending platform is an evolutionary step forward from previous technologies that require drastic change or even replacement of existing systems – an expensive, risky and time consuming process. In lieu of altering or replacing these existing systems, Thinkstream extends them into an efficient, cost-effective network that's surprisingly easy to use.

Our networks deliver reusable, flexible, real-time views of information that is scattered amongst myriad databases, Web sites and desktop PCs. Powered by the Thinkstream Platform, our networks can scale to

encompass hundreds or even thousands of information systems.

Thinkstream has the only technology on the market that can enable integrated criminal justice throughout entire state, multi-state or even nationwide networks. Similarly, it is the only technology available that can provide instant, up-to-date identity verification that is 100% accurate. The company is currently operating the Louisiana Civil and Criminal Information Network, considered to be the largest of its kind in the nation. Thinkstream is an active member of the Internet Working Group for Justice Integration Committee, established by the U.S. Department of Justice.
